# Who Are You: Yuki Nishiwaki

## Current Role

- Develop/Operate OpenStack based Private Cloud
- Plan/Develop/Operate Kubernetes as a Service

## Recent Talk

- Excitingly simple multi-path OpenStack Networking (May 2018, OpenStack Summit)

# Brief introduction of ourselves(Verda)

# The position against k8s from me

OpenStack based *Private Cloud*

openstack®

Server

Network

Database .....

New Resource Type

Me

Operator/Developer for Private Cloud

# Verda Kubernetes as a Service - Background

- We've seen about 600 k8s node users deployed/used on our Private Cloud
- Many teams find easy way/struggle to use/operate k8s

## Problem description

- Operating k8s is not such a small burden every developer can handle in spare time
- Knowledge of k8s operation is fragmented

*New Resource Type  
For Verda User*

# Verda Kubernetes as a Service - Target

- Provide stable Kubernetes Cluster to Verda User
  - Don't have to automate everything but we will take responsibility to operate
- Provide API to Verda User
  - CREATE/DELETE Kubernetes Cluster (UPGRADE is not the target at the moment)
  - ADD/REMOVE Node
- Provide “Service Desk”
  - To advise/consider how to use with Verda User(Application developer)

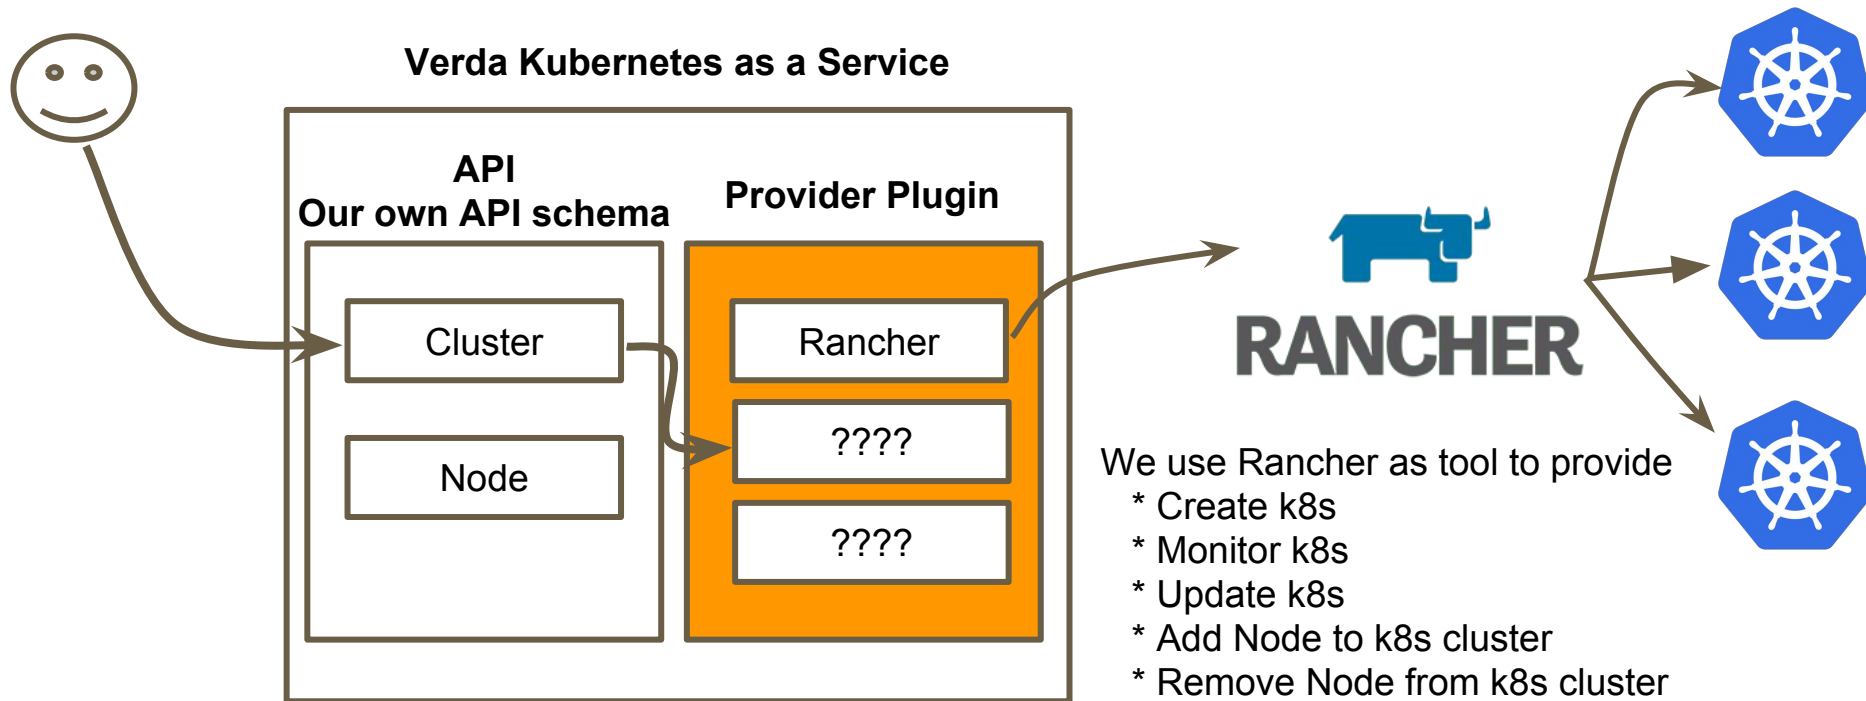

***New Resource Type  
For Verda User***

# Verda Kubernetes as a Service - Status of Project

- Start Project since May 2018
  - Pretty late, relatively
- Decided to utilize existing software(OSS)
  - Reduce lead time as much as possible
  - Rancher 2.0 is **one of the candidates** we will use
    - We are thinking to use **Rancher 2.0 for Phase 1**
- Still deciding which is good to use for managing k8s part
  - Or Will we have to develop from scratch?

# Less dependent design - Still considering

# Roadmap

## Phase 1

Phase1 (2018/09/01)

- \* This is First release
- \* No change for Kubernetes/Rancher
- \* Support only basic k8s cluster
- \* Support Limited Number of Cluster
- \* Train ourselves
  - \* For Rancher (because we depended)

## Phase 2

### Phase2 (Planning)

- \* Enhance VKS control plane(Tune Rancher)
  - \* Support More Clusters
  - \* Enhance monitoring item
  - \* Enhance GUI
- \* Enhance k8s support
  - \* Support Type Loadbalancer for in-house LB
  - \* Support Persistent Volume
  - \* Optimizing Container Networking
- \* Train ourselves
  - \* For Kubernetes, Etc

## Phase 3

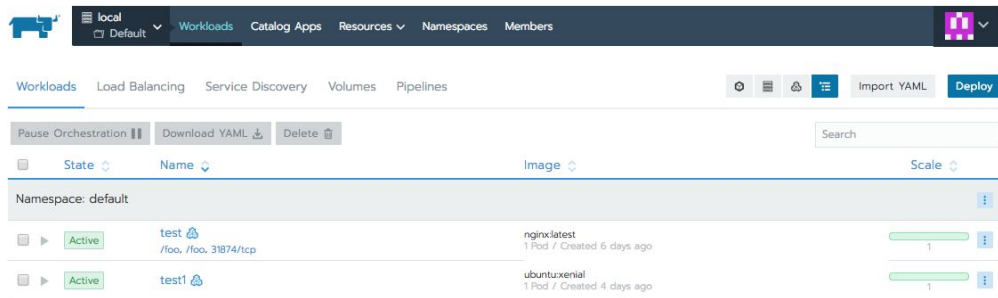

### Phase3 (Planning)

- \* Enhance k8s support
  - \* CRD/Controller for in-house Component
  - \* Prepare skeleton template to make it easy to start development
  - \* Consider solution about how k8s cover whole system including VM (kubevirt)

# About Rancher 2.0

# What's Rancher?

- Container Management Tool
- Support to deploy Container Orchestration Tool itself like Kubernetes
- Make “Container Orchestration itself” abstract and Provide rich UI
- UI allow you to deploy your container workload easier than native console
- UI allow you to use well-tested catalog

# Rancher 2.0 Released (May 1 2018)

- Focus on using Kubernetes as a Container Orchestration Platform
- Re-design to work on Kubernetes from scratch
- Re-Implement from scratch
- Introduce Rancher Kubernetes Engine (RKE)
- Unified Cluster Management including GKE, EKS... as well as RKE
- Application Workload Management

# Rancher 2.0

## Our Interest as a backend For our “k8s as a service”

- Focus on using Kubernetes as a Container Orchestration Platform
  - Re-design to work on Kubernetes from scratch
  - Re-Implement from scratch
  - Introduce Rancher Kubernetes Engine (RKE)
- Unified Cluster Management including GKE, EKS... as well as RKE
  - Application Workload Management

# Rancher 2.0

## Our Interest as a backend For our “k8s as a service”

- Focus on using Kubernetes as a Container Orchestration Platform
  - Re-design to work on Kubernetes from scratch
    - Don't have to understand multiple container orchestrators
  - Re-Implement from scratch
    - Readable amount of code (about 50,000~80,000 lines except for vendoring)
  - Introduce Rancher Kubernetes Engine (RKE)
    - Support Deploy/Upgrade/Monitor Kubernetes cluster
    - Less requirements for the environment to build k8s
- 
- Unified Cluster Management including GKE, EKS... as well as RKE
  - Application Workload Management

# As a context: backend for Verda K8s as a Service

- In our use case, User/Operator for Rancher is different
  - Operator: Cloud Operator (us)
  - User: Application Developer<sub>s</sub> for LINE Service
- Down time of Rancher affect to many users

Need to know well about How Rancher works

# But Documentation....

The screenshot shows a GitHub repository for 'rancher / rancher'. The issue title is 'Add more documentation for developers of Rancher 2' with ID #13933. A comment by user 'jomeier' is highlighted with a red box. The comment text is: 'I'd love to contribute to this project but reverse engineering through the code is horrible :-)' The Rancher 2 architecture document is a minimal starting point for getting a feeling how the API might work. The last days I worked on documentation and a few scripts which enable me to remote debug Rancher 2 from a GO IDE. I created a pull request for that: #13932 Please please please create more documentation about how Rancher 2 works, how we can contribute to fix bugs and enhance it. Maybe it's also a good idea to create a Slack channel for Rancher Developers. This project is awesome and we want to get our hands on it. Give us more documentation, please :-)' The comment has 1 like. On the right side, there are labels: 'area/documentation', 'kind/enhancement', and 'version/2.0'.

To be honest,  
It's difficult to operate Rancher 2.0 with  
just official documents

Like Rancher 1.0, majority of Rancher 2.0 software runs on the Rancher server. Rancher server includes all the software components used to manage the entire Rancher deployment.

Figure 2 illustrates the high-level architecture of Rancher 2.0. The figure depicts a Rancher server installation that manages two Kubernetes clusters: one Kubernetes cluster created by RKE and another Kubernetes cluster created by GKE.

# Let's unbox Rancher 2.0

## <v2.0.0>

本資料は、調査資料を一部抜粋して作成しています。

# 1. Rancher Overview

## 1. Rancher Overview

- 1.1. Casts in Rancher 2.0
- 1.2. What Server does?
- 1.3. What Agent does?
- 1.4. Summary

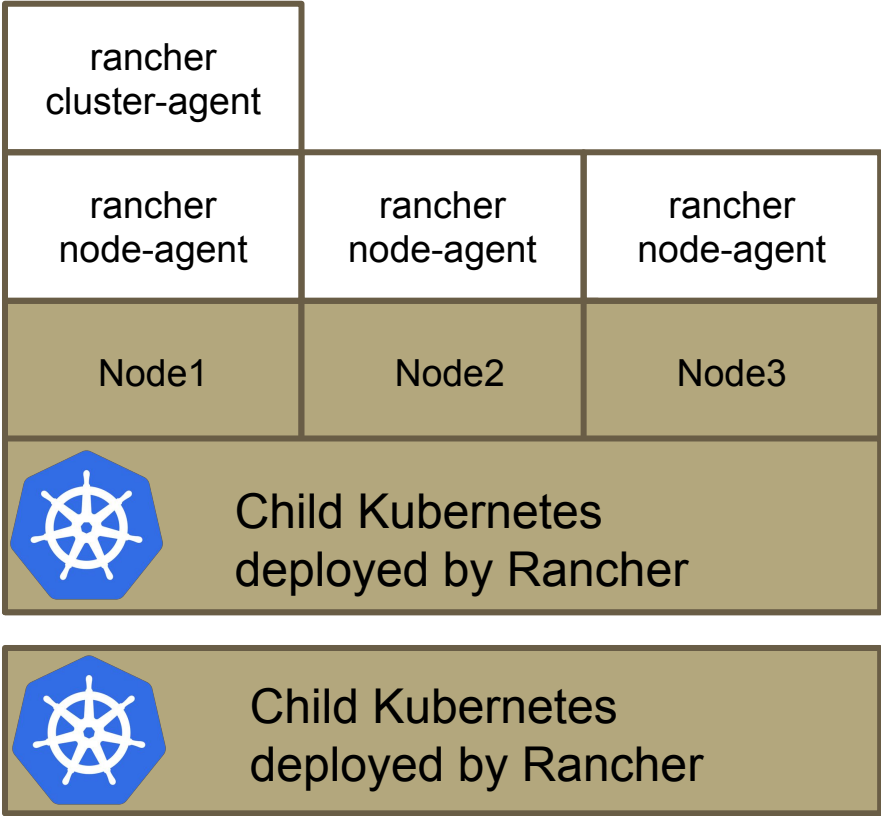

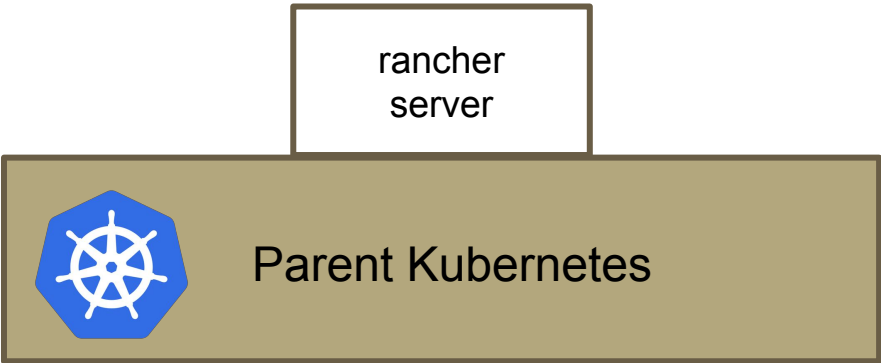

## 2. Rancher Server Internal

- 2.1. Rancher API
  - 2.2. Rancher Controllers
  - 2.3. Example Controllers
-

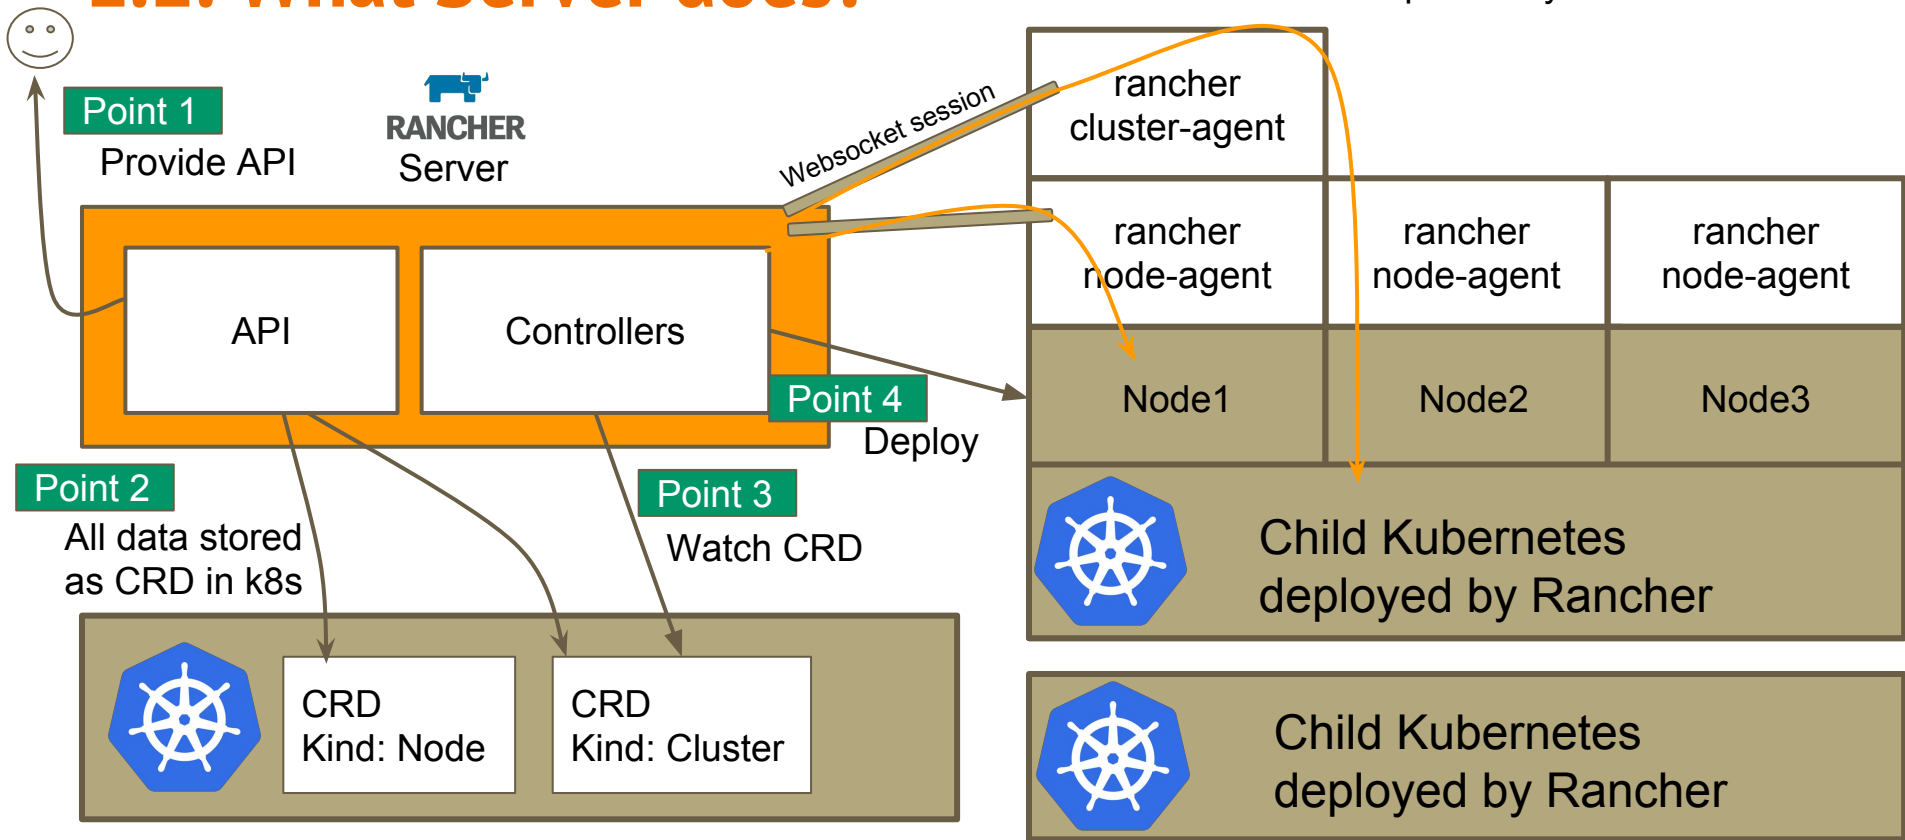

Parent k8s: k8s working with rancher  
Child k8s: k8s deployed by rancher

# 1.1. Casts in Rancher 2.0

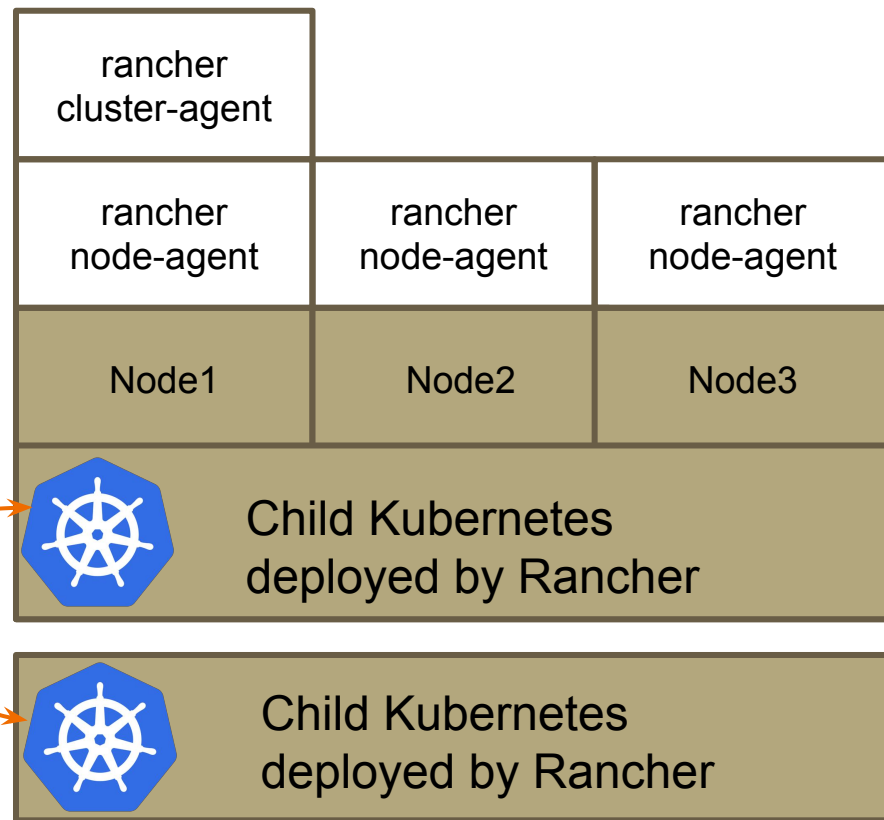

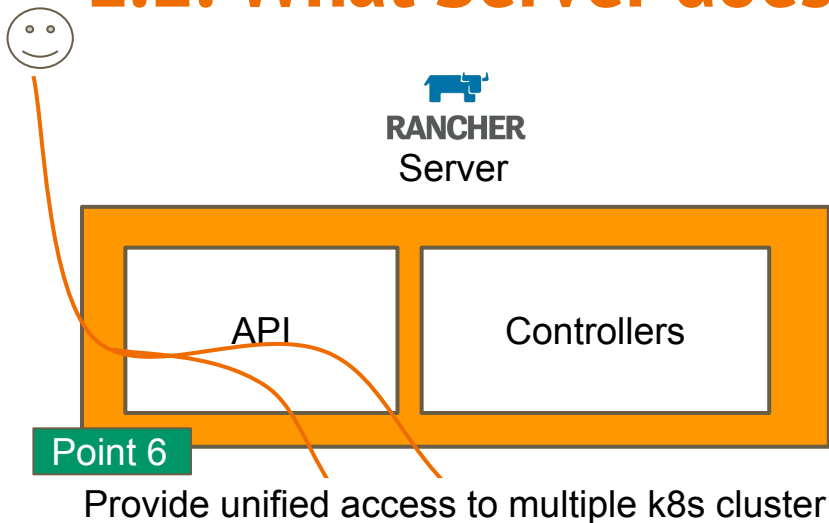

- Rancher Server
- Rancher Cluster Agent
- Rancher Node Agent

## 1.2. What Server does?

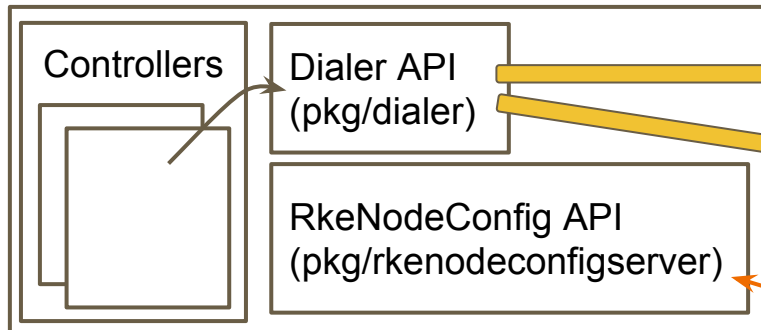

## 1.2. What Server does?

# 1.3. What Agent does?

Use session  
For access  
(k8s, docker)

  
**RANCHER**  
Server

Parent Kubernetes

Point 1

Establish websocket session

websocket session  
(/v3/connect)

/v3/connect/config

Point 3

Check If file,container need to  
create/run or not periodically

Point 2

Provide TCP Proxy  
via websocket

  
**RANCHER**  
Cluster Agent

  
**RANCHER**  
Node Agent

Node A

  
**RANCHER**  
Node Agent

Node B

Child Kubernetes

Rancher Agent basically establishes websocket to provide TCP Proxy and just checks NodeConfig periodically. Almost all configurations will be done/triggered by controllers through websocket

Parent k8s: k8s working with rancher  
Child k8s: k8s deployed by rancher

## 1.4. Rancher 2.0 overview summary

Almost all logics are in Rancher Server and Agent is just sitting as a TCP Proxy

If we want to know more about How Rancher maintain Kubernetes Cluster, It's enough to see just Rancher Server. Because Agent is just to provide proxy.

- b. Check periodically if node need to create something file or run something container

## 2. Rancher Server Internal

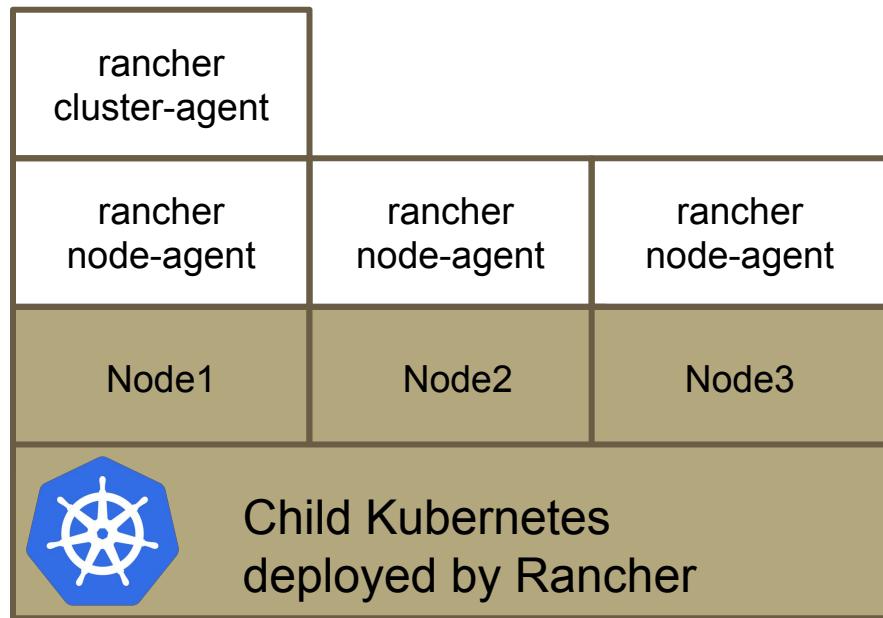

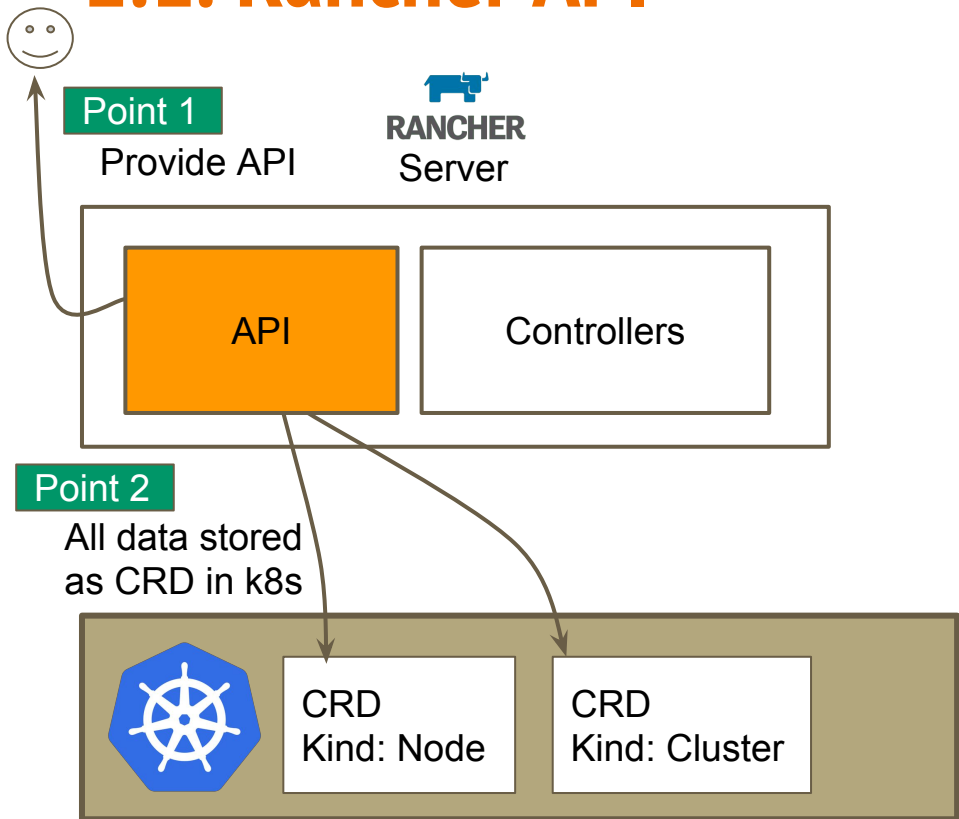

### 1. Rancher Overview

- 1.1. Casts in Rancher 2.0
- 1.2. What Server does?
- 1.3. What Agent does?
- 1.4. Summary

### 2. Rancher Server Internal

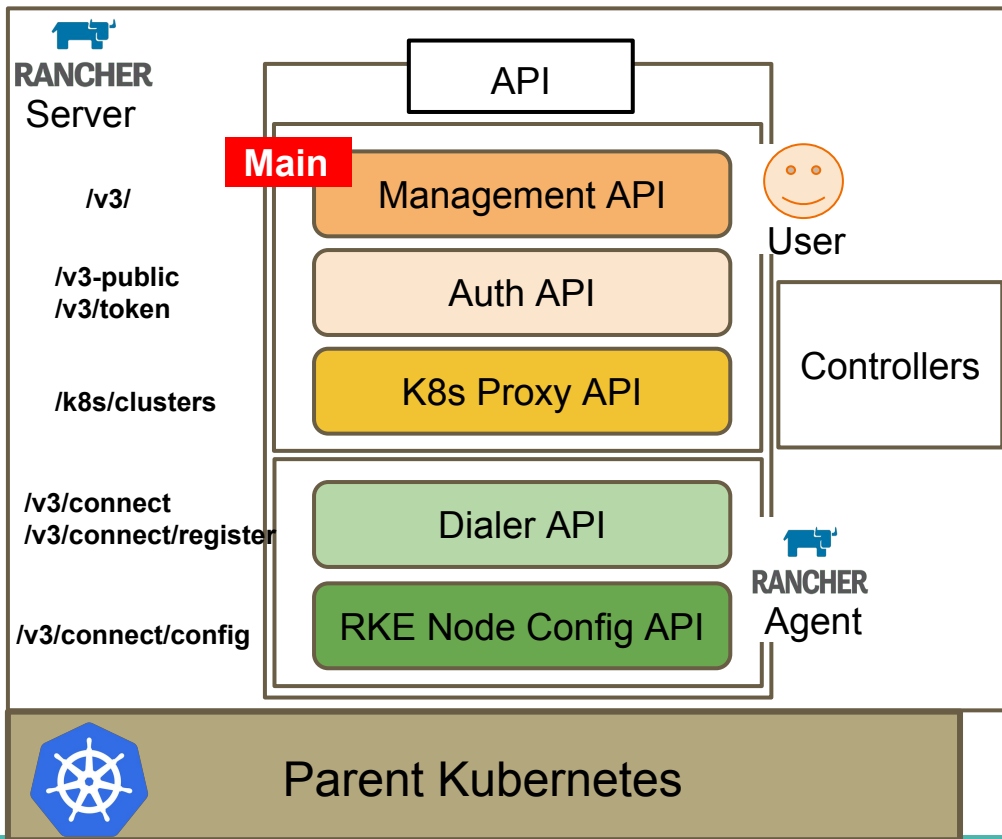

- 2.1. Rancher API
  - 2.2. Rancher Controllers
  - 2.3. Example Controllers
-

## 2.1. Rancher API

## 2.1. Rancher API

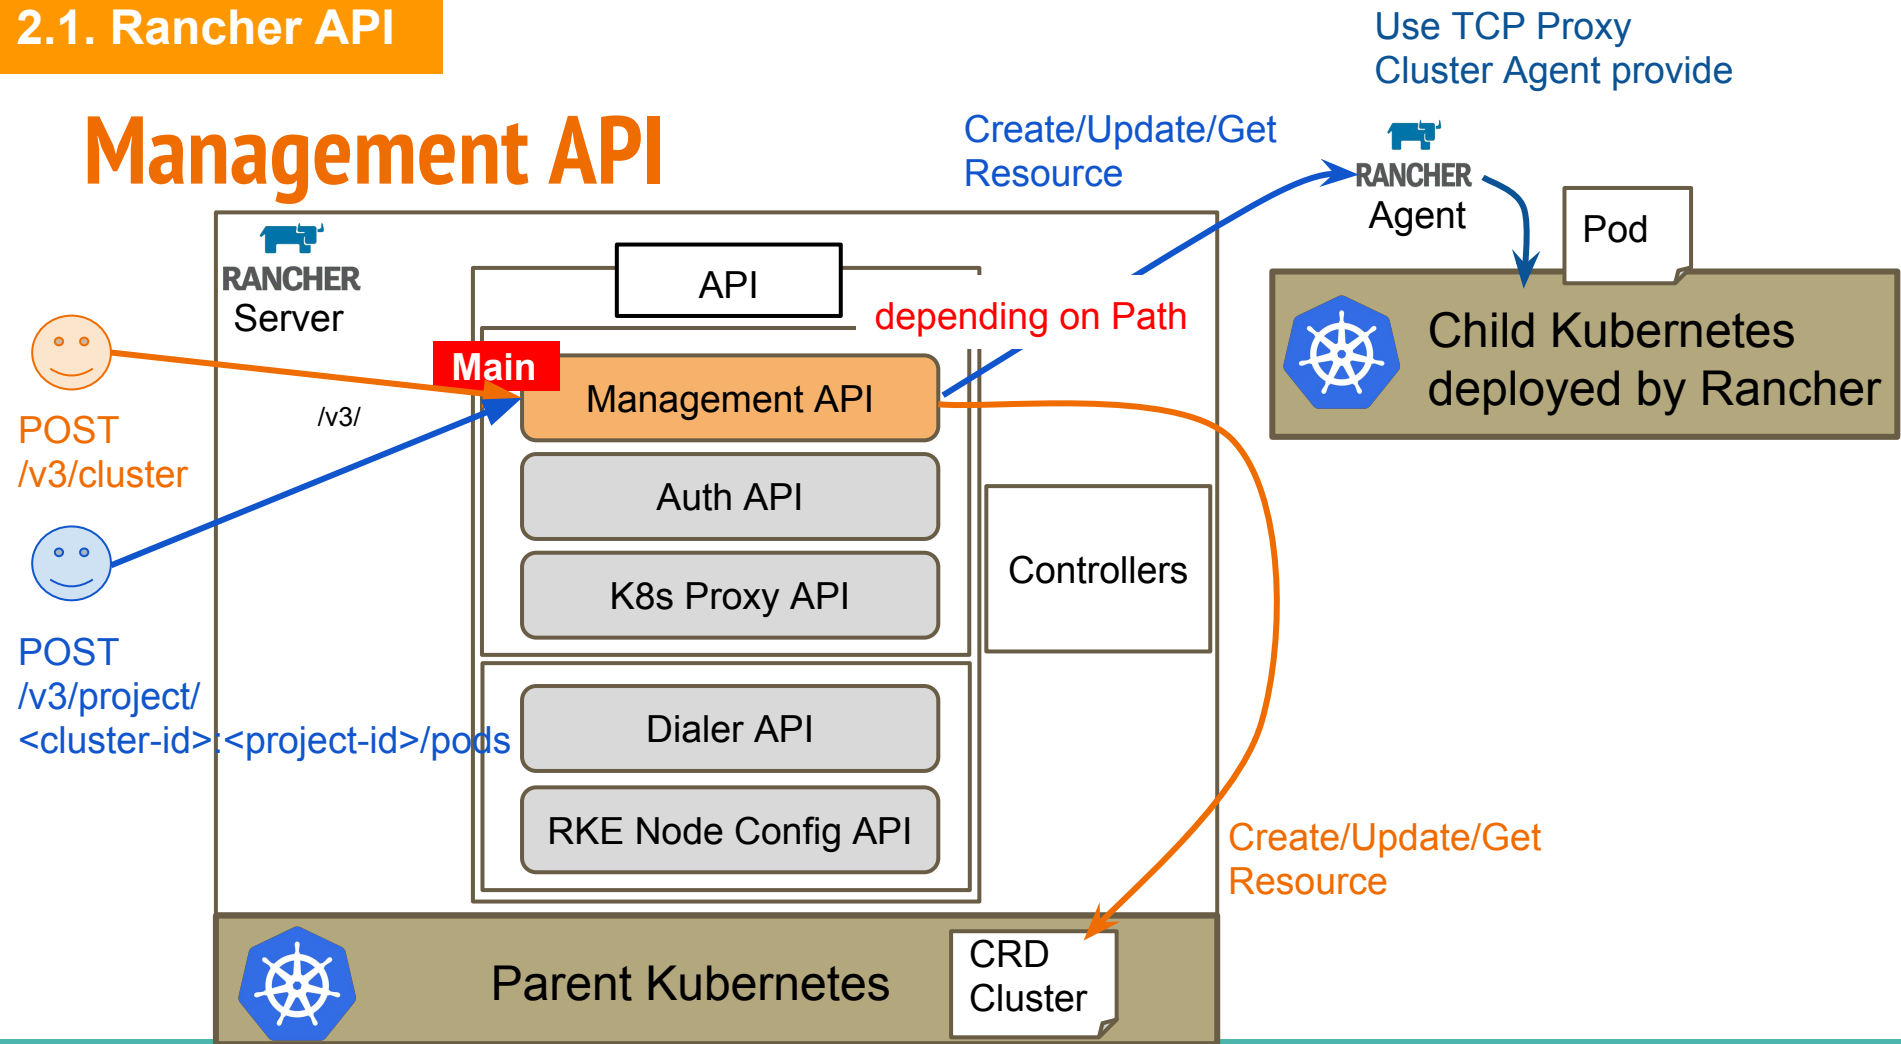

# 5 types of API

- API can be classified into 5 types
- Some API is for only Agent
  - API for user
    - Management
    - Auth
    - K8s Proxy
  - API for agent
    - Dialer
    - RKE Node Config

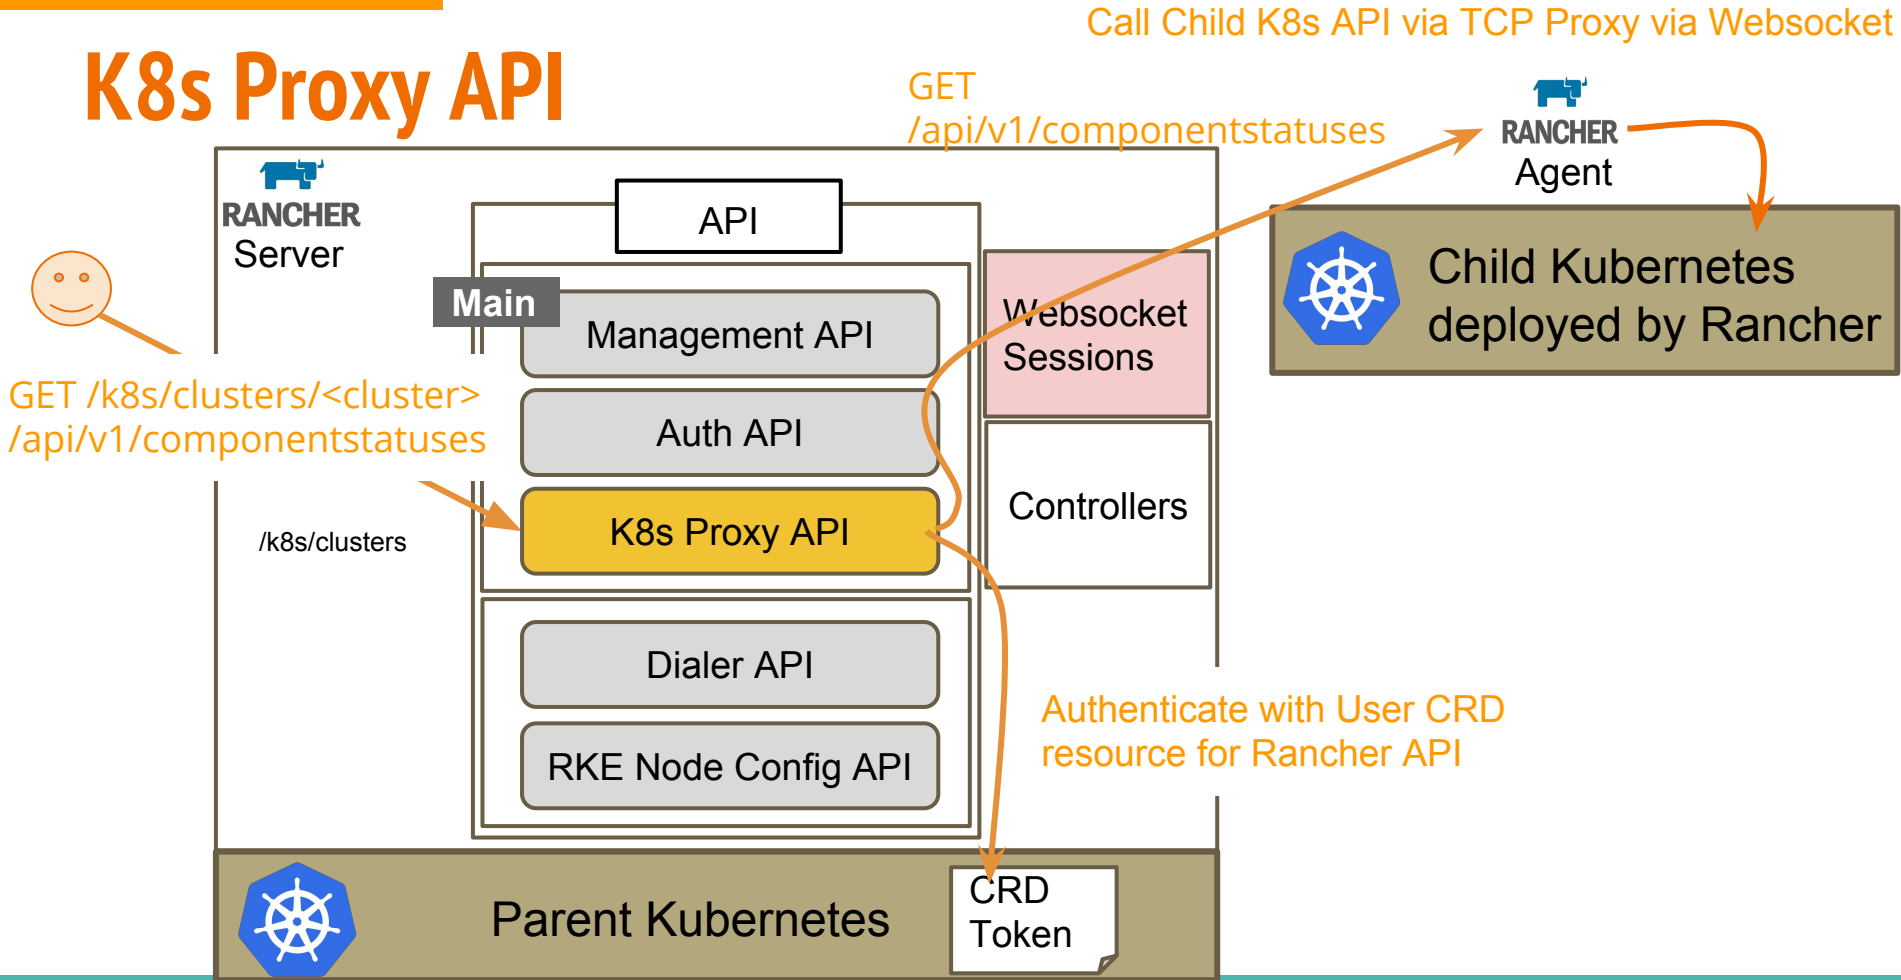

## 2.1. Rancher API

# Management API

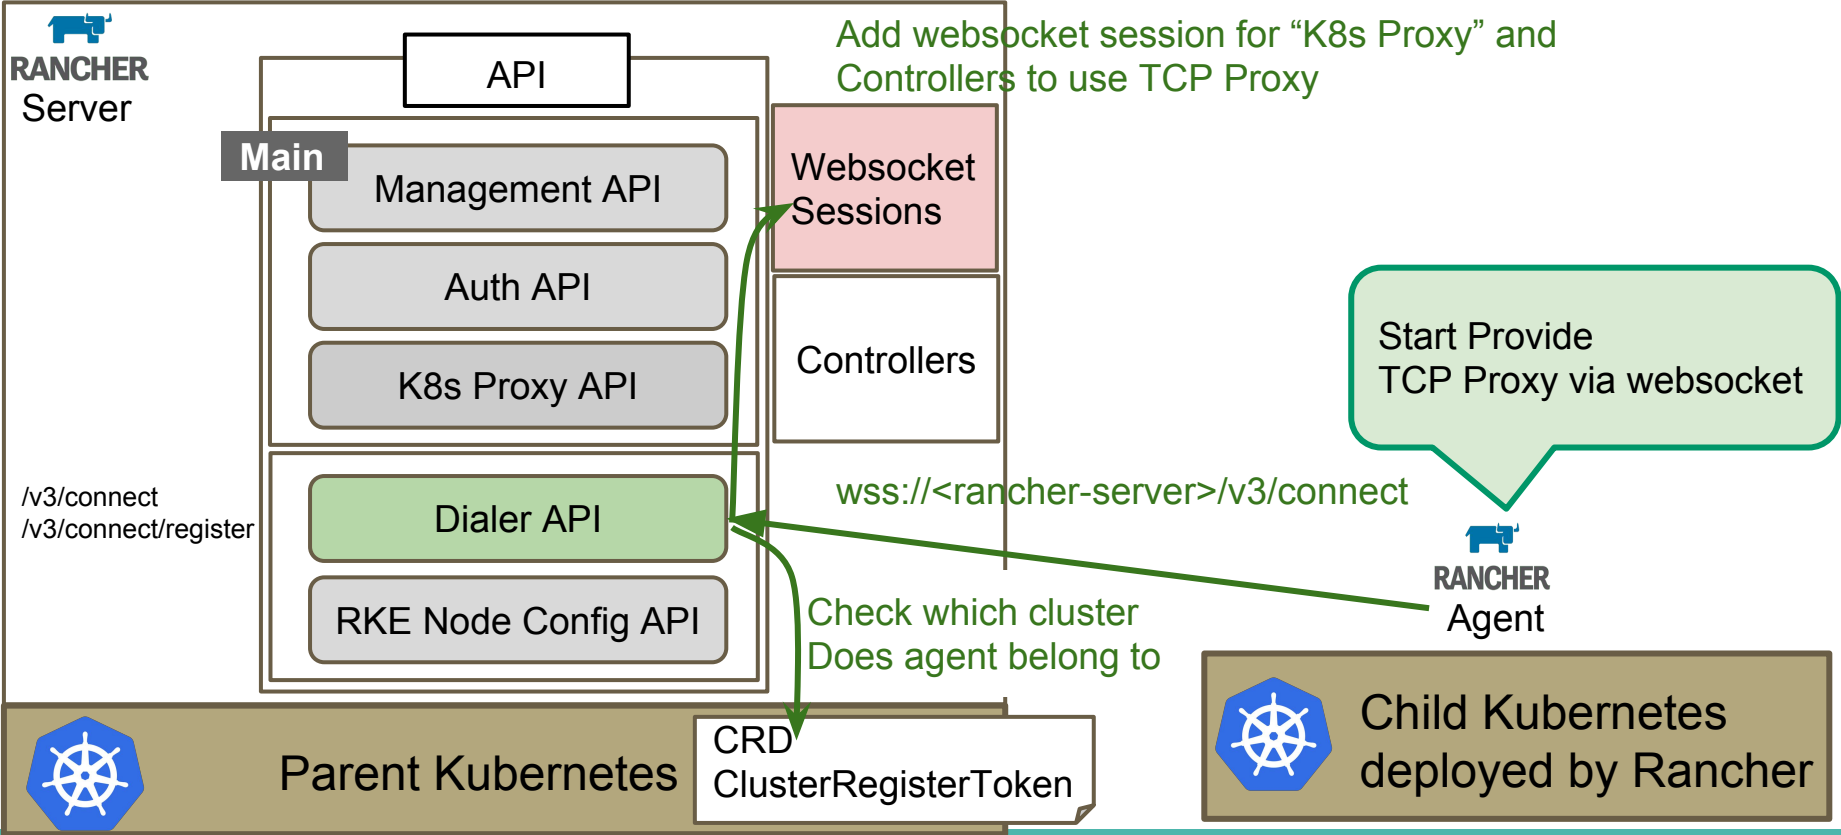

## 2.1. Rancher API

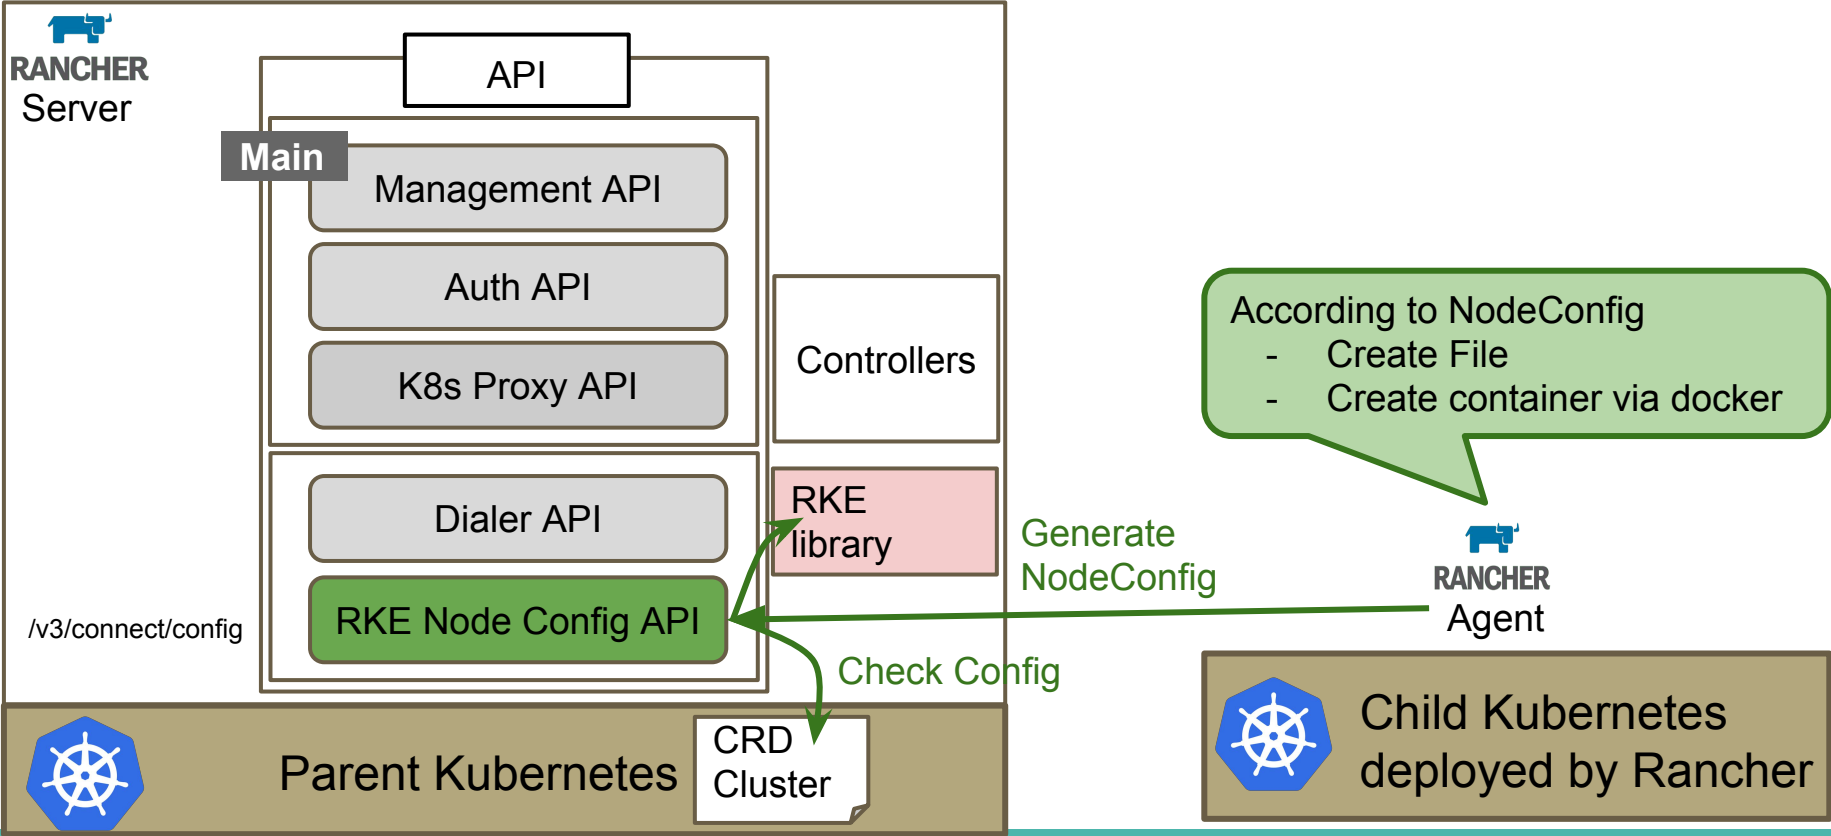

# K8s Proxy API

## Dialer API

# RKE Node Config API

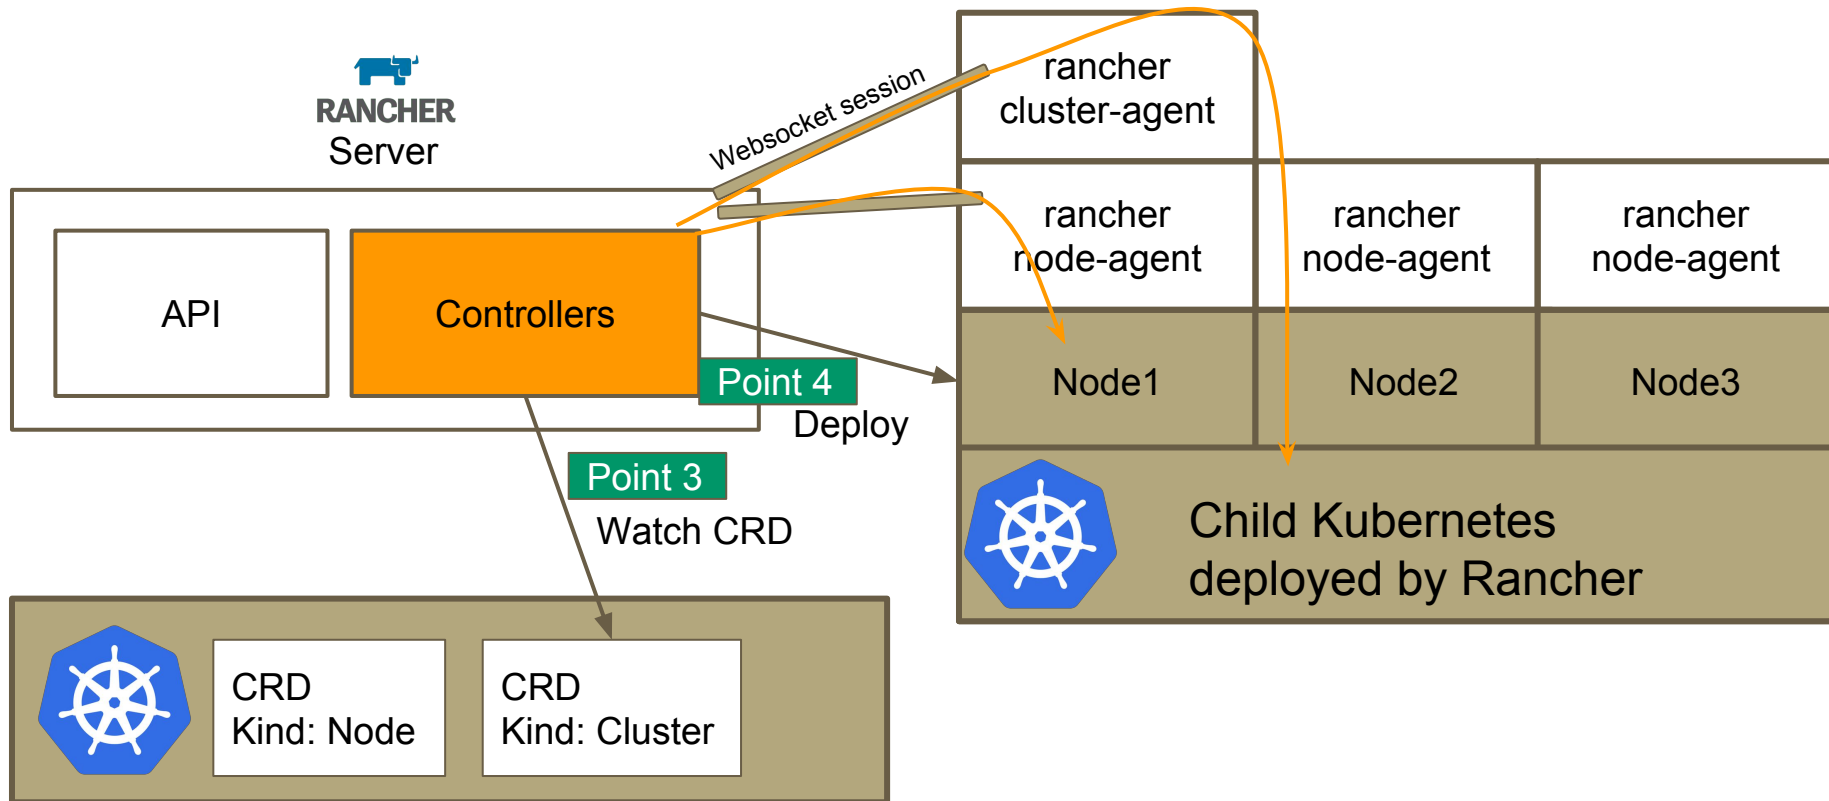

## Point 5

Monitor Cluster/Sync Data

Call docker/k8s API via websocket, If need.

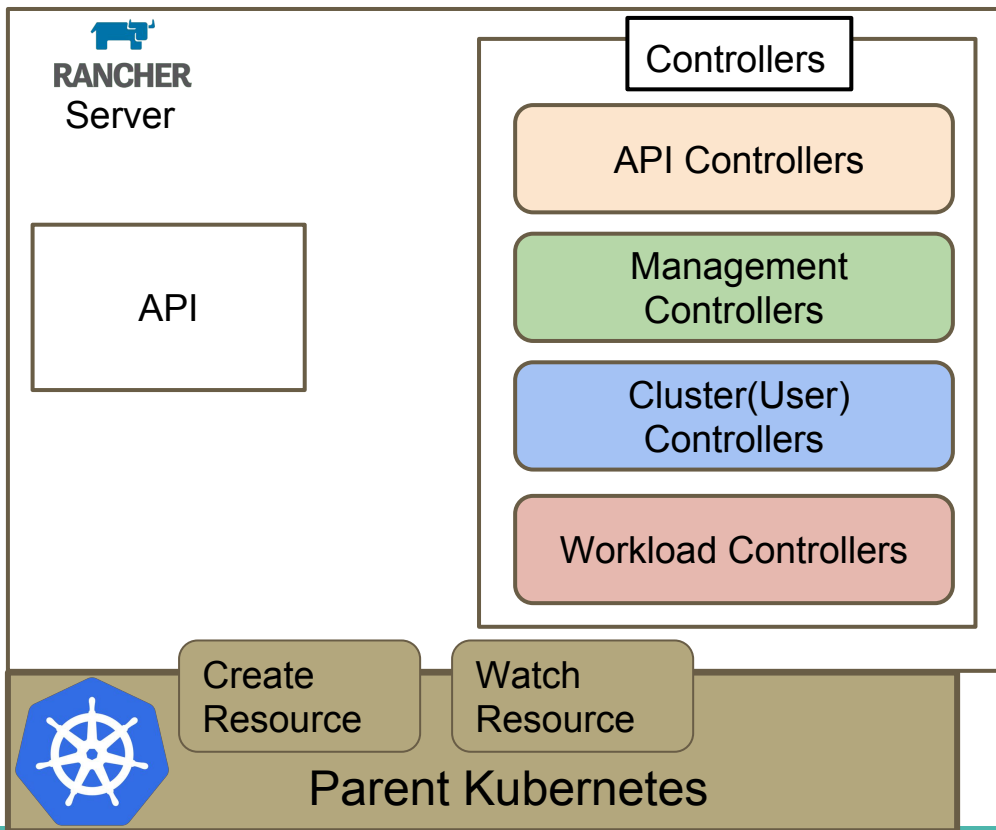

Don't access to docker/k8s api directly from rancher server

# 2.2. Rancher Controllers

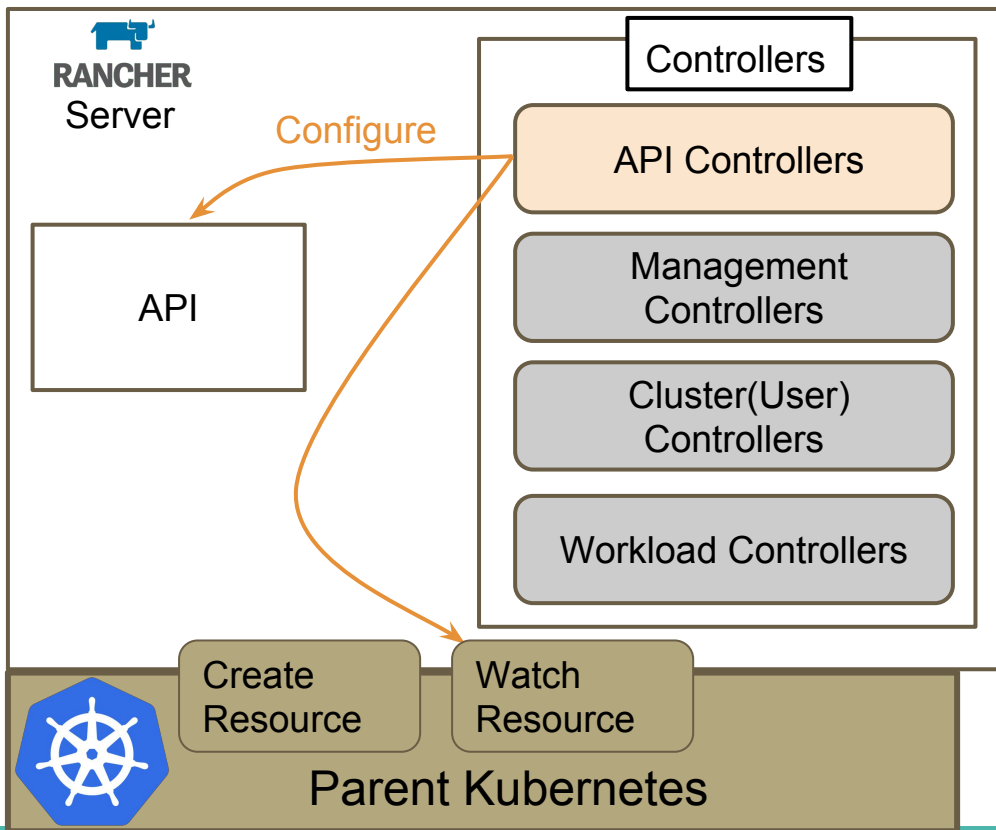

# 4 types of Controllers

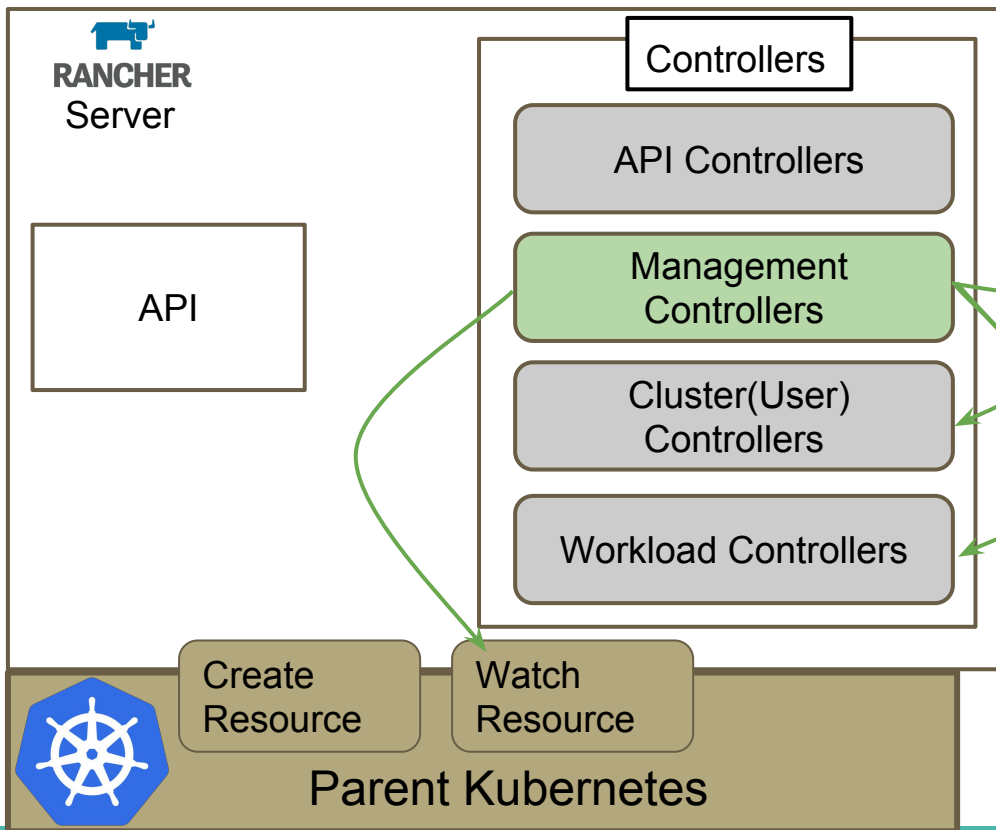

- Rancher Controllers can be classified into 4 types of group
- Each group have own trigger to start
- Triggered when Server start
  - API Controllers
  - Management Controllers
- Triggered when new Cluster detected
  - Cluster(User) Controllers
  - Workload Controllers

# API Controllers

- Watch CRD resource related to API Server Configuration
  - settings
  - dynamicschemas
  - nodedrivers
- Configure API server according to the change of resource

# Management Controllers

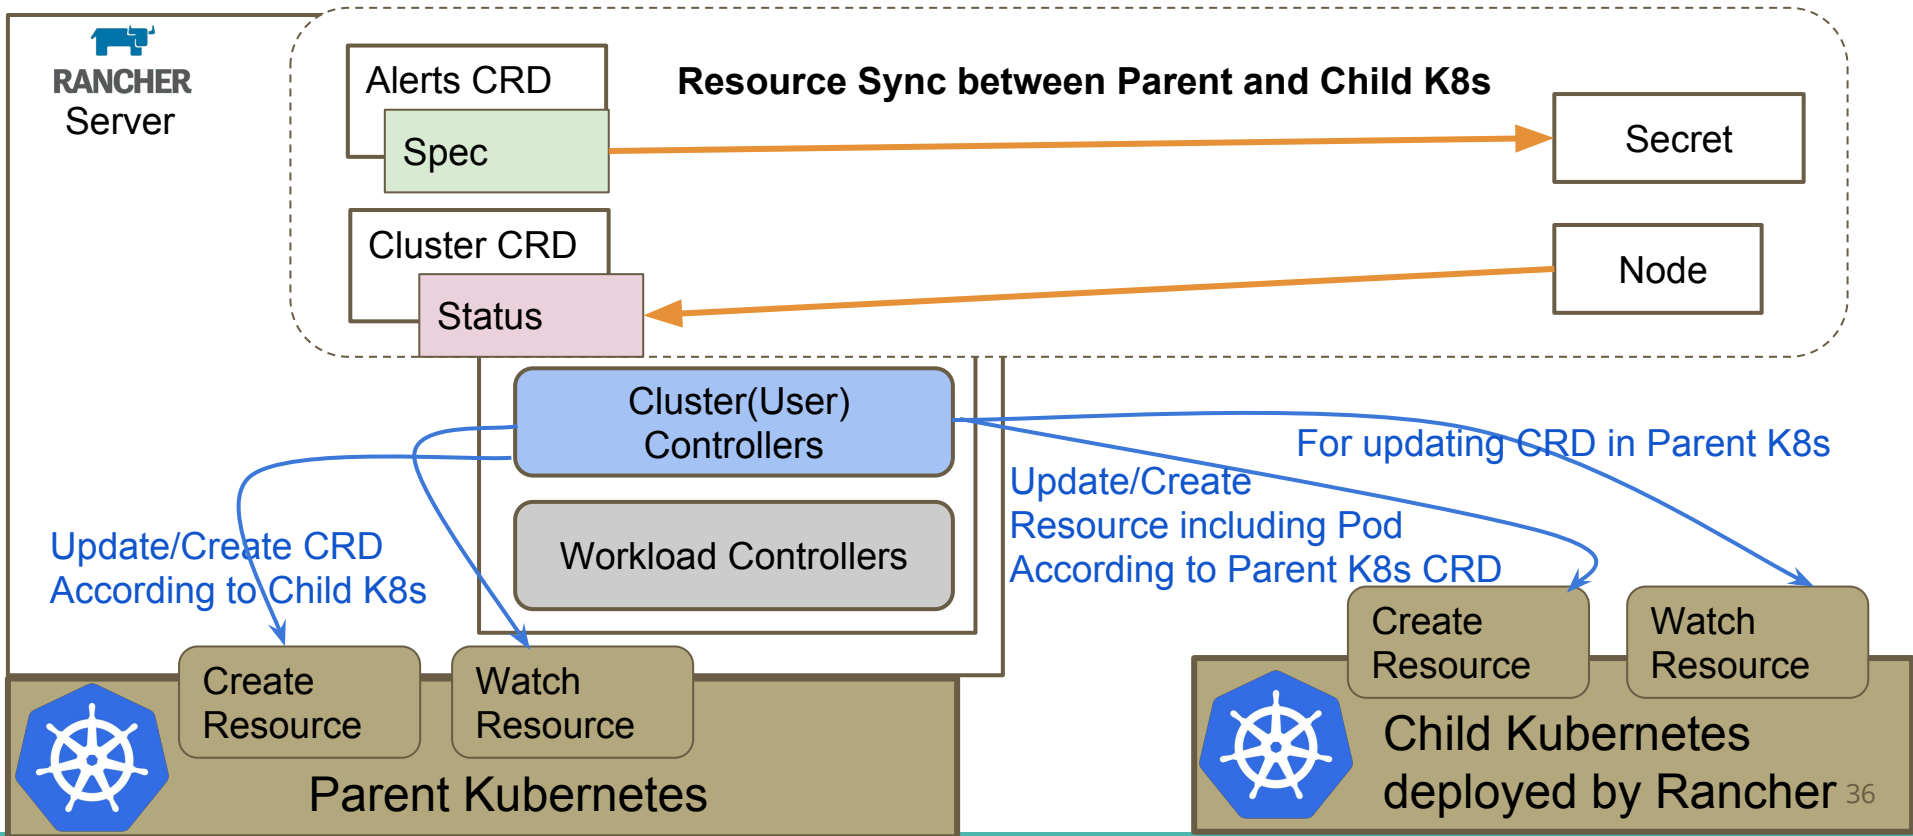

- Watch Cluster/Node related CRD
- Provision/Update Cluster according to the change of resource
- After Provision, Start Cluster(User), Workload Controllers to start data sync and monitor

*Provisioning/Update Cluster*

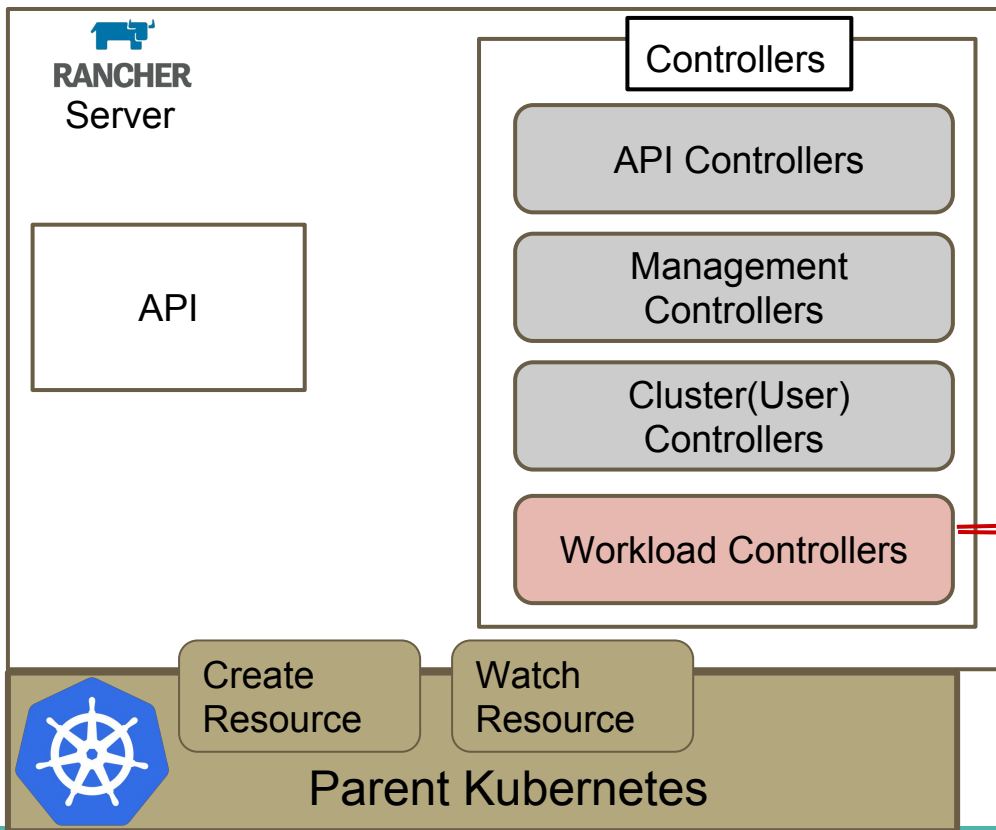

*Start Cluster(User),  
Workload Controllers*

# Cluster(User) Controllers

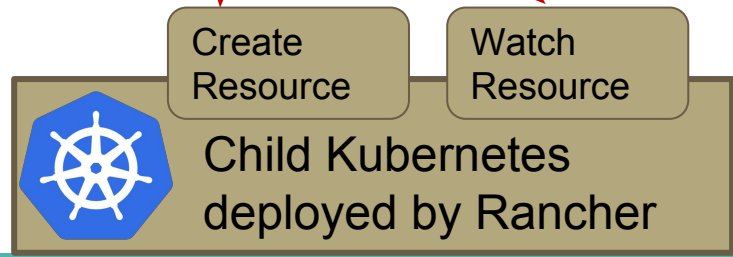

# Workload Controllers

- Watch only resource@Child K8s
- Create/Update additional resource
- These Controller are more like enhancing K8s feature itself

The Simple Custom Controller to extend K8s

## 2.3. Examples: Controllers

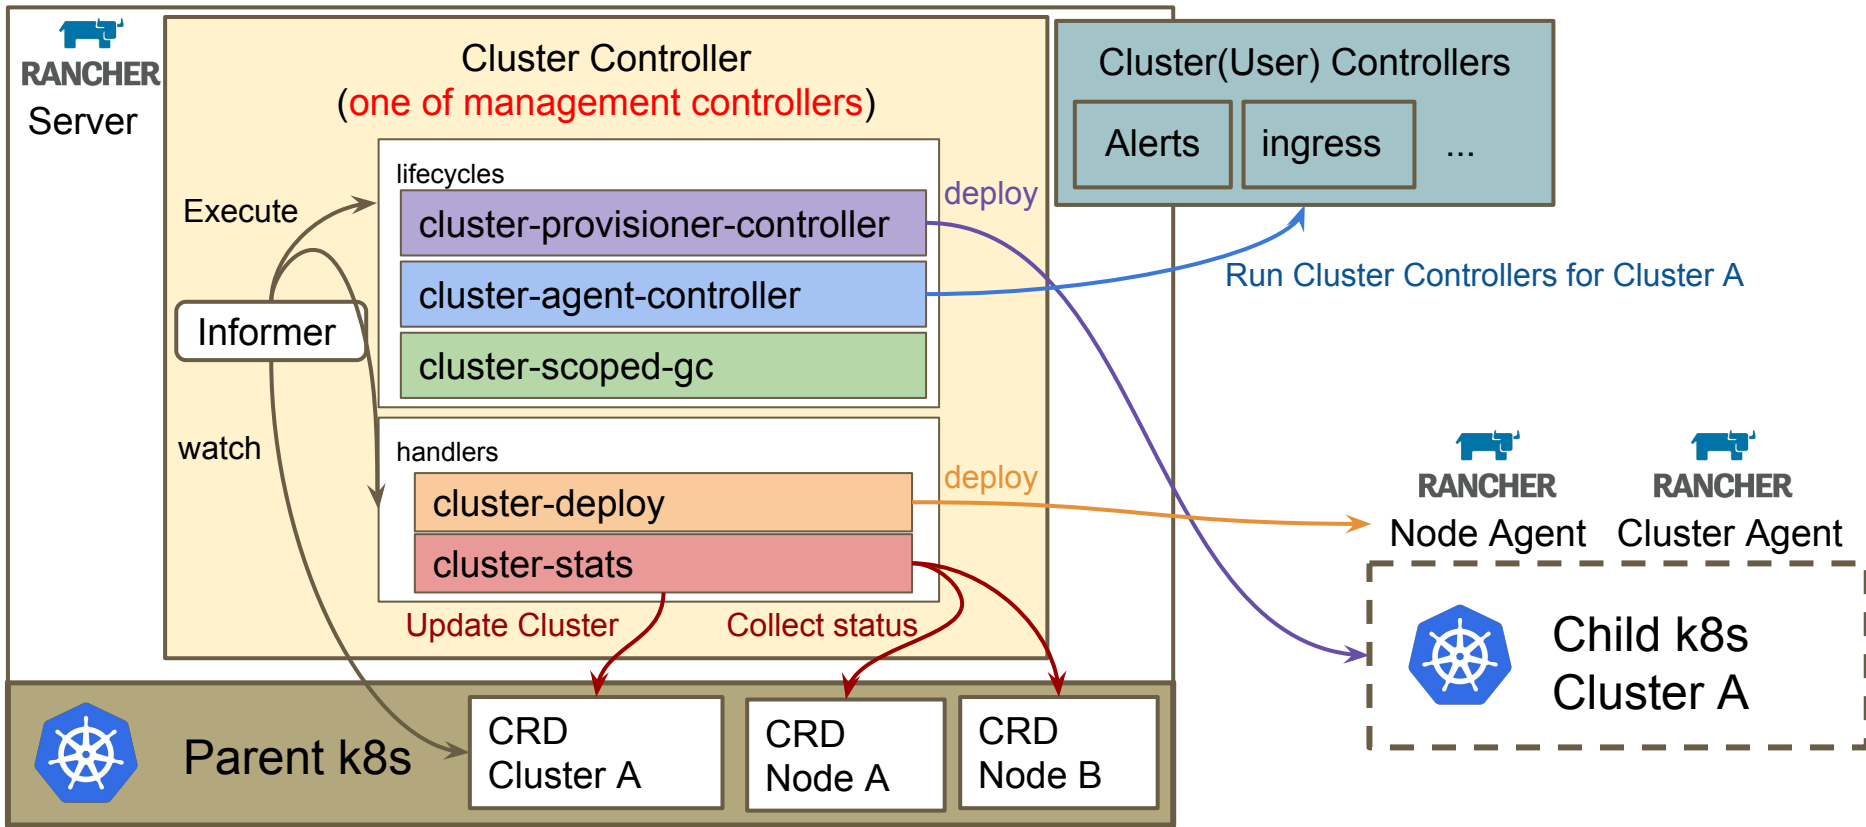

### Management Controllers

- Cluster Controller
- Node Controller

### Cluster(User) Controllers

- ClusterLogging Controller

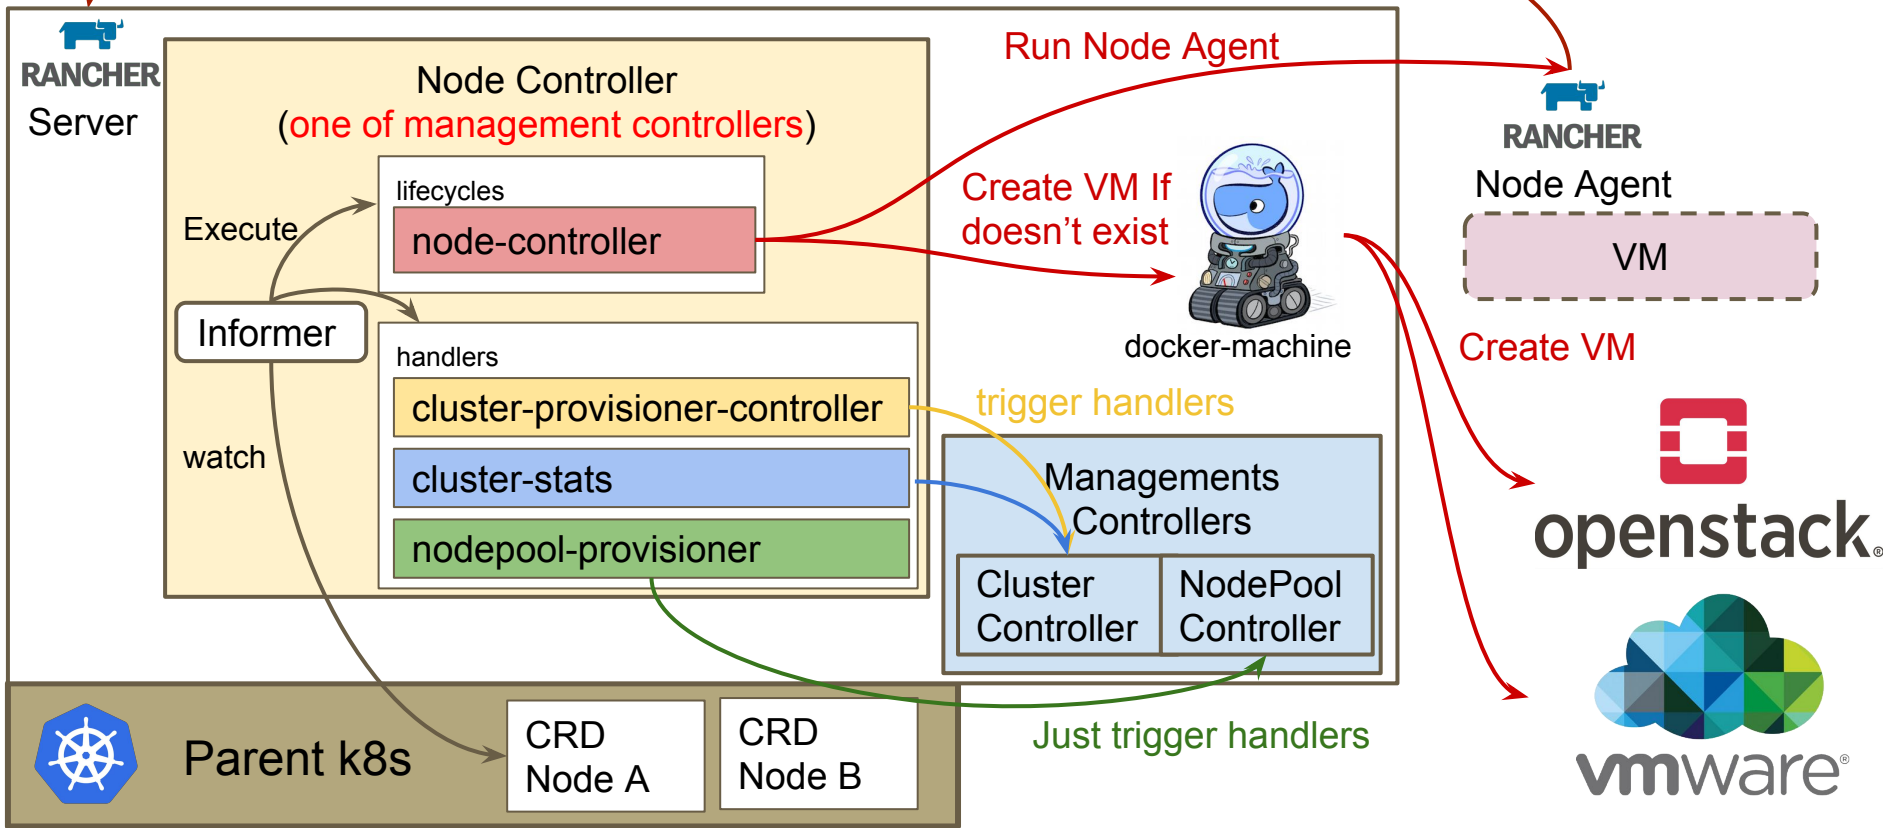

# Cluster Controller Implement (pkg/controllers/management)

## 2.3. Example Controllers

Call `wss://<server>/v3/connect/register`  
To register node into specific cluster

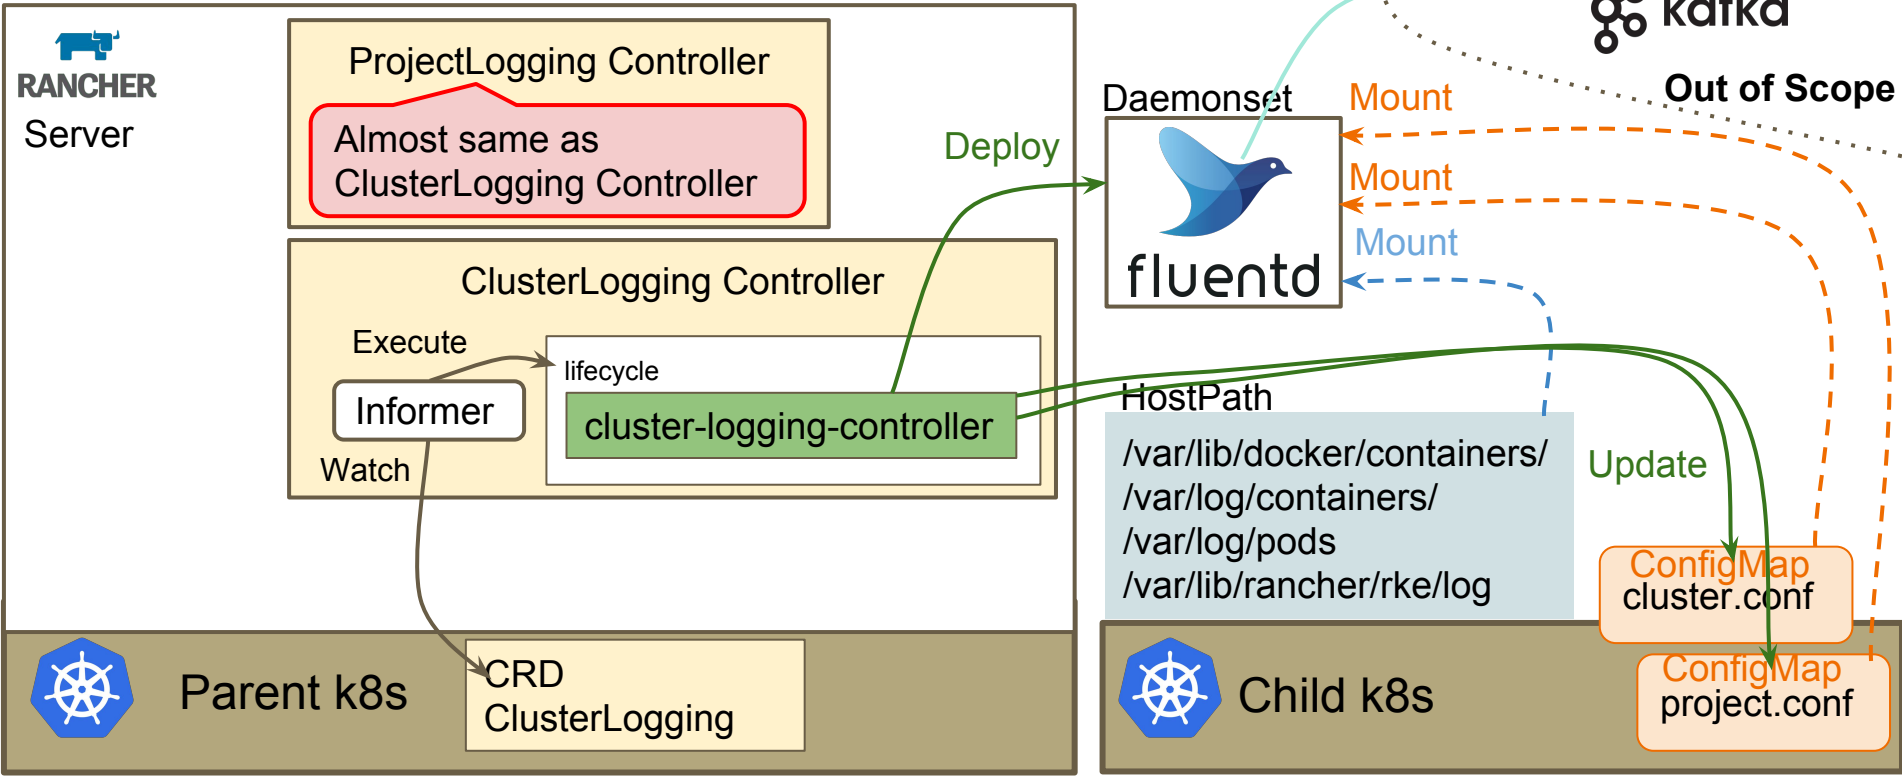

# Node Controller Implement (pkg/controllers/management)

# Cluster(Project)Logging Controller Implement

(pkg/controller/user/logging/)

**How I look Rancher 2.0**

**In the context of backend for Verda k8s as a Service**

# Good thing: we are thinking to utilize

- Less requirement for environment to run
  - but this cause some scalability limitation at the same time though...
- There are some interesting Controllers like alert, logging, eventsync ...
  - We can utilize these feature to manage K8s Cluster
- Easy to modify/add Rancher behaviour thanks to Norman Framework
  - We will utilize this framework to extend even for k8s

# Not good thing: we are thinking to improve

- Poor Document (Currently reading code is only way to know)
  - Norman Framework that Rancher actively used is also less document
- Doesn't support Active-Active HA
  - Scalability limitation cannot be avoided
- 1 binary that have ton of features make it difficult to do performance tuning
- Even for K8s Proxy API, we can not deploy multiple process because that feature depend on websocket session to cluster-agent
- Poor monitoring relying on kubelet and componentstatus
- Upgrading Strategy is just to replace old container with new one. Is it enough?

<https://github.com/rancher/rke/blob/master/services/kubeapi.go#L15> , <https://github.com/rancher/rke/blob/master/docker/docker.go#L72>

# **Future Work**

## **Verda Kubernetes as a Service**

# Future Works

- Use Rancher 2.0 as a backend to manage k8s without any change at Phase 1
  - Modify Rancher and Give feedback to community in the long run after Phase 1 release
    - Enhance scalability
    - Enhance monitoring
    - Cut(or Disable) many unneeded features to us
- Enrich Kubernetes deployed by RKE
  - Support Type Loadbalancer for our XDP based Loadbalancer
  - Support Persistent Volume
  - Add CRD/Controller to support our In-house Component like Kafka, Database as a Service
    - We want Kubernetes to be orchestration tool for System not for Container
- Need more k8s/etcd itself knowledge
  - !!!!Read Code!!!! Not only just books/documents!!
    - Kubernetes
    - Etcd

# We are hiring people!!!

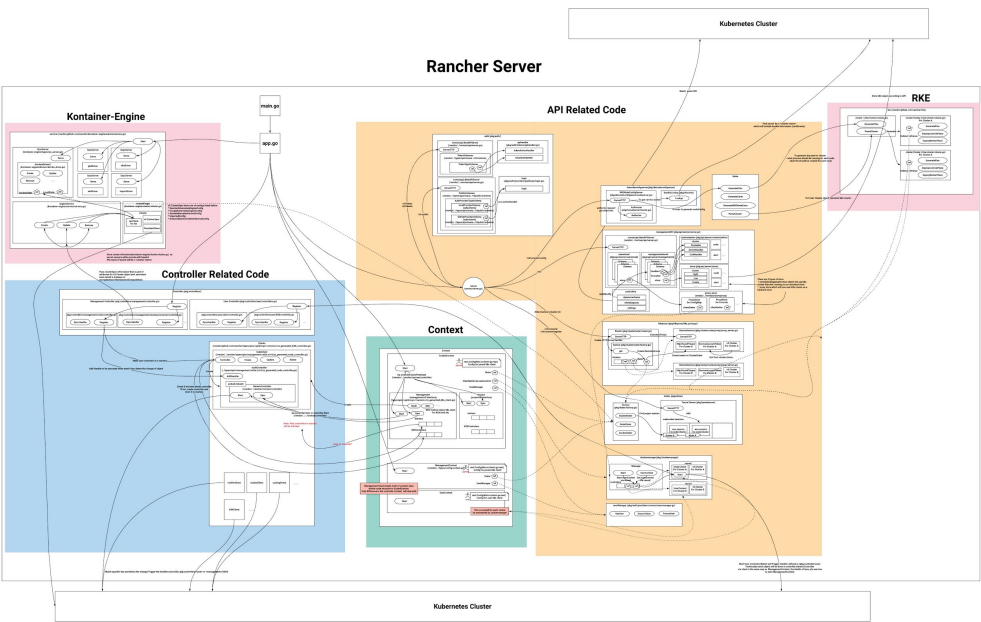

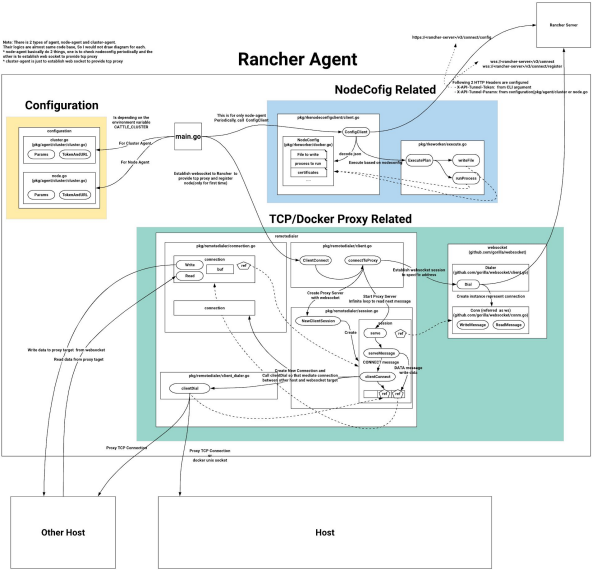

- Love to understand/customize OSS at source code level
  - Kubernetes
  - Etcd
  - OpenStack
  - Rancher
  - Ceph...
